

Why Server-Based Font Management?

Design, print and publishing environments face many challenges with managing fonts in their workgroups. These challenges are unique to a workgroup environment and cannot be addressed by stand-alone, desktop font management solutions.

The answer for these challenges is server-based font management, which provides administrators with the control they need to truly manage their fonts across a workgroup environment.

Universal Type Server[®] is the leading corporate professional font manager. It's a true client/server system that provides a live, collaborative environment to share fonts across any workgroup. It allows font administrators to manage users and workgroups for compliance and consistency, as well as centrally store, update and control type libraries for ease, efficiency, and security. Universal Type Server is a true cross-platform solution, supporting Macintosh and Windows systems for both server and connecting clients.

Key Advantages

Centralizes font management administration and control

Server-based font management gives administrators a central "base" from which to store, organize, control and deploy fonts to an unlimited number of users. This saves administrators significant time and streamlines the process of getting the right fonts to the appropriate users that need them — when they need them.

With a centralized system, administrators have the power to manage the fonts (i.e., add, delete, modify, clean up system font folders, address font problems, etc.) for each user from one location, eliminating the need to visit each user's desktop. Additionally, Extensis' server-based font management solution allows for continuous updating of the clients, meaning that any font changes or updates made for a particular user, group or the entire organization can be managed from one location and then instantly updated on the appropriate client machines.

Administrators have the flexibility to perform their duties from anywhere with modern, web-based interfaces for managing users, fonts and server maintenance. Universal Type Server provides this capability by providing web-based interfaces to allow administrators to remotely and conveniently start, stop, backup, restore, add users, modify user permissions, etc.

Ensures font usage consistency

Many font problems stem from the fact that users don't always have the fonts they need and have to scramble to find the right font. In a workgroup environment, these font problems are magnified because users often have different versions of the same font, making it easy to use an incorrect font. This can cause inadvertent text reflows, line ending problems, etc., and ultimately result in delays in the workflow.

A server-based font management solution addresses this problem by giving administrators an easy and convenient way to ensure that all users have all the fonts they need all the time, even ensuring that users have the exact same version of the font. Extensis' server-based font management solutions give administrators an easy and convenient way to assign fonts to specific users and groups, giving them instant access to the approved fonts they need.

Ensures font license compliancy

Rogue fonts can create havoc in a workflow and make managing font licenses virtually impossible. A server-based font management solution gives administrators the ability to not only control which fonts a user can access but what sort of activities each user can do with the fonts on their system. Extensis' server-based font management solution provides administrators the ability to set font use permissions (or privileges) on a user-by-user basis (e.g., permitting/not permitting a user to add local fonts, activate or de-activate fonts locally, collect fonts for output).

This ensures that an unpermissioned user cannot use non-approved fonts because he has no way of getting them activated on his machine. These solutions also allow administrators to address potential font conflicts before they become conflicts by giving them much tighter control over the fonts in their workflow. Fonts can be screened and approved for each group before being added to the server and therefore, accessible to users.

Extensis solutions also include administrative functions analyzing and reporting on font license compliance, helpful tools to forecast licensing needs. Universal Type Server also prevents users from installing unlicensed fonts on their systems by creating a "white list" of allowed fonts, and removing any unapproved fonts from client machines.
